DEKADAL TECHNICAL NOTE FOR FIRST DEKAD OF JUNE, 2021
AND PRECIPITATION FORECAST FOR WEEK 2 AND 3

Drafted and Presented by **Maimuna Borno**

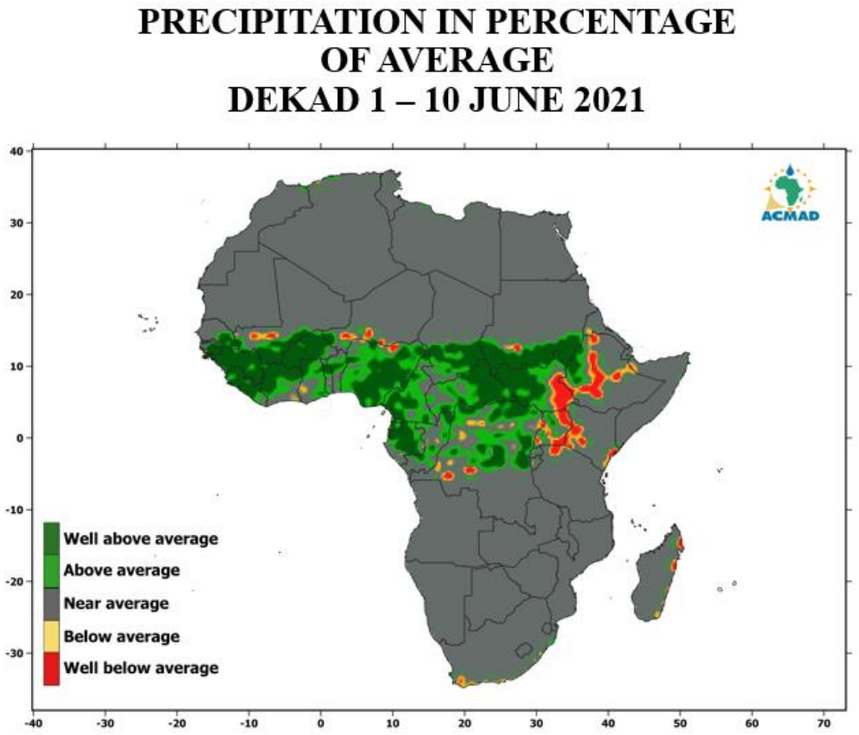

Edited by: **Hubert KABENGELA**

Content of the Technical Note

1. Monitoring Climate Element
   - Percent of precipitation
   - Temporal variation of precipitation
   - Precipitation deviation
   - RH anomaly
2. Global Driver Review and Assessment
   - Weekly and monthly SST anomaly assessment
   - Dekadal velocity potential with MJO, Kelvin and Rossby Wave
   - Weekly PWAT observed and outlook
   - Dekadal OLR anomaly
   - MSLP anomaly
   - Wind anomaly at 850 and 700 hPa
   - Relative humidity anomaly

3. Weekly Climate outlook
   - Monthly MJO forecast
   - Two week wind anomaly and divergent forecast
   - GFS total precip weekly forecast
   - GEFS weekly precip exceedance forecast
   - Weekly wind forecast
   - Monthly tercile prob precip anomaly forecast
   - NCEP/GFS bias corrected ensemble forecast
   - IRI SubX precip forecast
   - Two week climatology
   - Two weeks precip forecast

Estimate Cumulative Precipitation in % of average for the First dekad of June and Wk2 Jun 2021

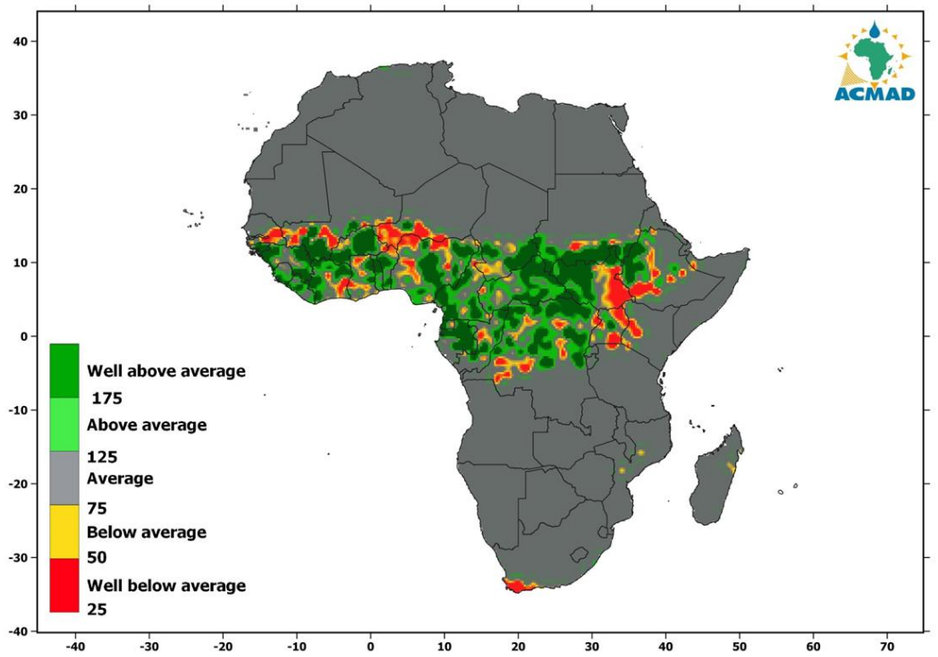

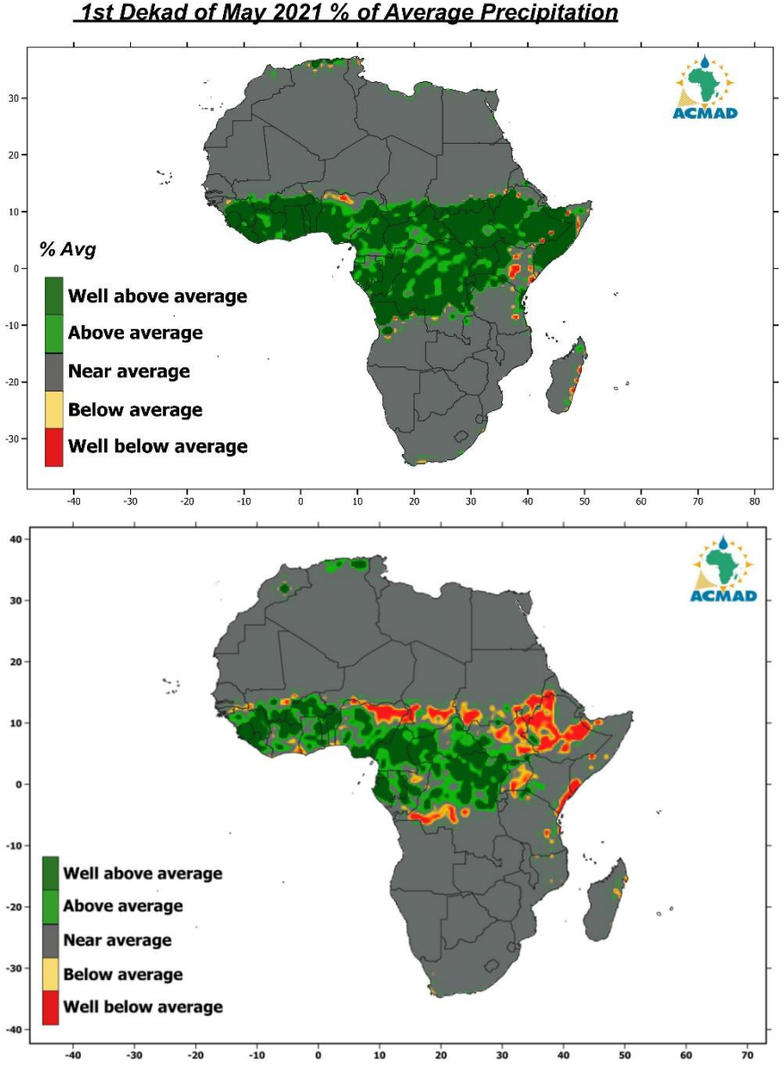

Figure 1: **This map displays decadal average precipitation in percent of average**

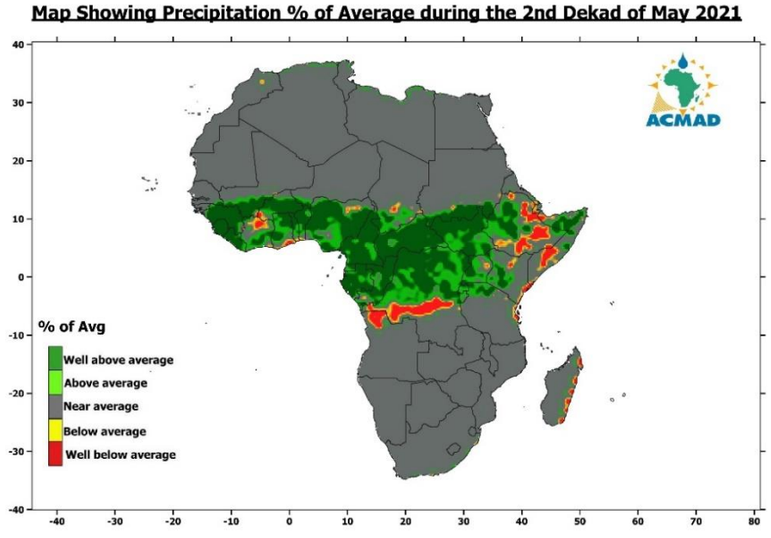

The figure shows that well above to above average précipitation prevailed over the countries around the equator, with western Ethiopia and eastern Uganda and Sudan receiving well below average rainfall during the 1st Dekad of June and Week 2 June 2021.

Data : SOURCES/.NOAA/.NCEP/.CPC/.FEWS/.Africa/.DAILY/.ARC2/.daily/.est_prcp/X/-20/0.5/70/GRID/Y/-40/0.5/40/GRID/T/%2821-31%20Jul%202014%20%29RANGE/T/SUM/

Temporal and spatial change of % of average precip for the last four consecutive dekads

The maps displayed show that from the first dekad of May, there was a slight improvement in the rainfall over Kenya despite some pockets still experiencing well below average rainfall. During the second Dekad of May, the rainfall situation worsened over eastern Africa. The eastern parts of Ethiopia, Kenya and southern Somalia experienced below average rainfall. The extreme northern Angola extending into central DRC received well below normal rainfall, including northern parts of Cote D'voire, Nigeria, and the extreme southern parts of Chad, Ghana and Togo. Otherwise most Countries over the Equator and latitude of 10N received above to well above average rainfall. The rainfall situation worsened during the third dekad of May over eastern parts of Africa, whereby all the countries experienced well below normal rainfall. Central African and Gulf of Guinea Countries continued to experience above to well above average rainfall. The first dekad of June shows that well above to above average précipitation was observed over the countries around the equator, with western Ethioopia and eastern Uganda and Sudan received well below average rainfall.

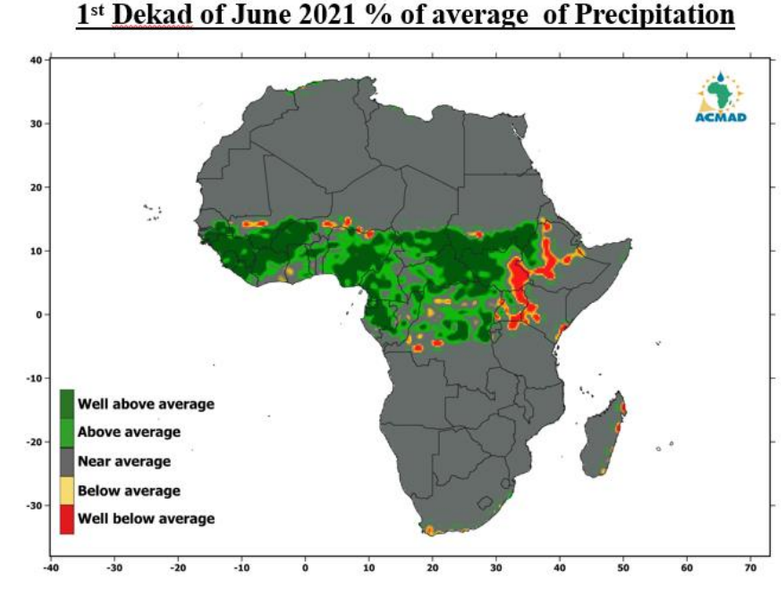

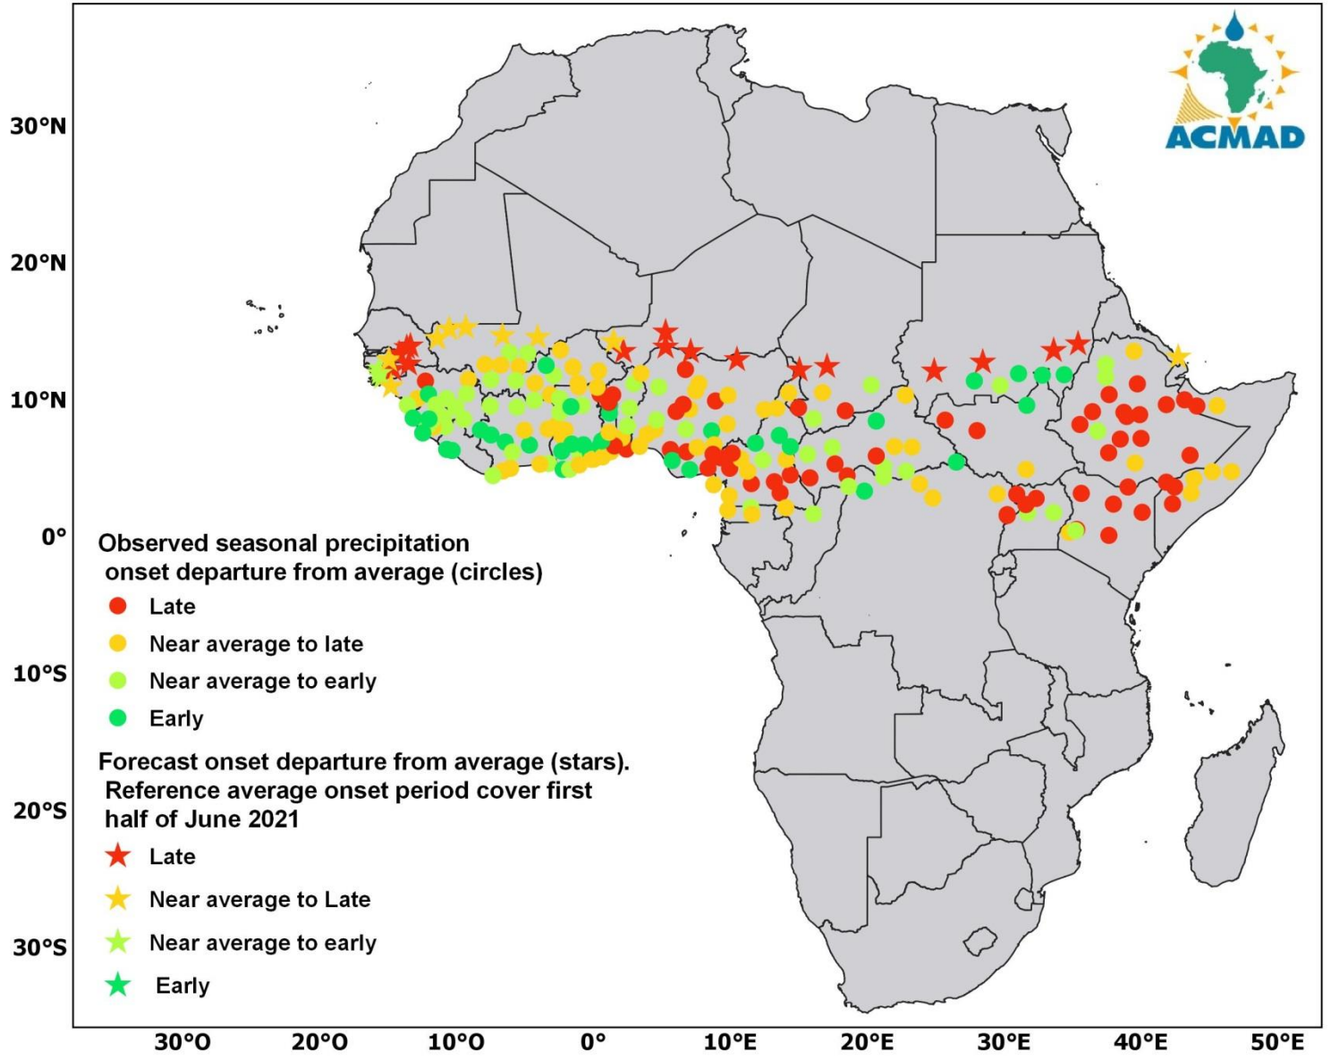

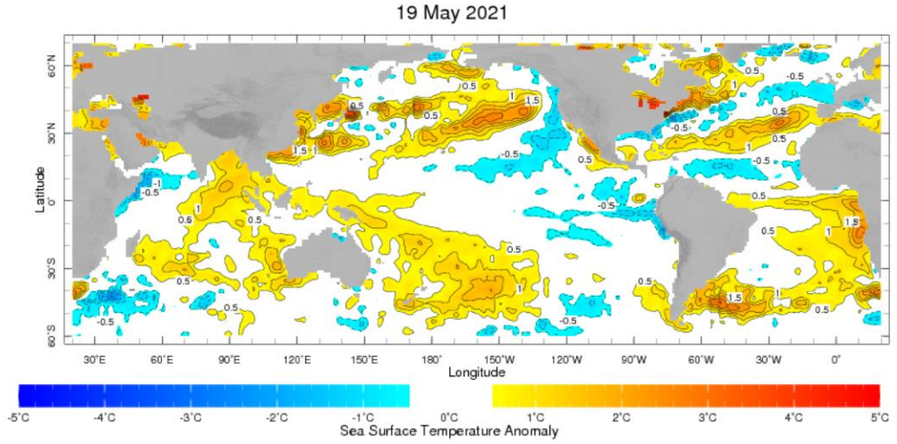

Figure 2: **This map displays decadal average precipitation in percent of average**

PRECIPITATION ONSET OBSERVATION AND OUTLOOK VALID FOR THE NEXT 2 WEEKS: JUNE 01 TO 15, 2021.
ISSUED: JUNE 01, 2021

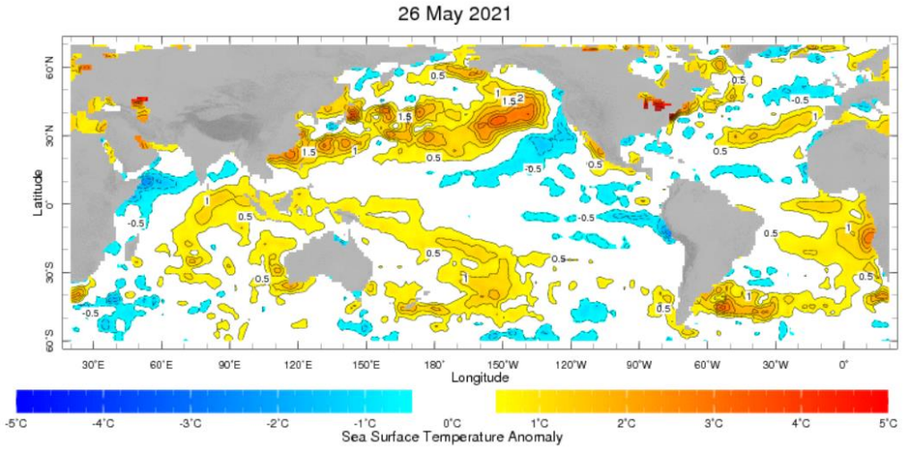

Weekly Sea Surface Temperature Anomaly

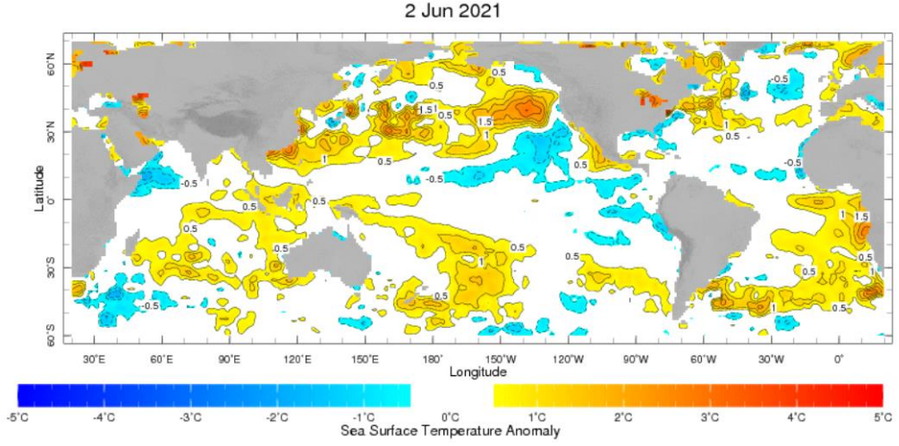

These maps display weekly sea surface temperature anomalies over the globe, and they depict mostly normal to cooling conditions over the equatorial Pacific with warm SSTs observed over northern Atlantic and the south-western Indian ocean.

https://psl.noaa.gov/map/clim/sst.shtml

01 June – 10 June 2021 http://iridl.ldeo.columbia.edu/maproom/Global/Ocean_Temp/Weekly_Anomaly.html?

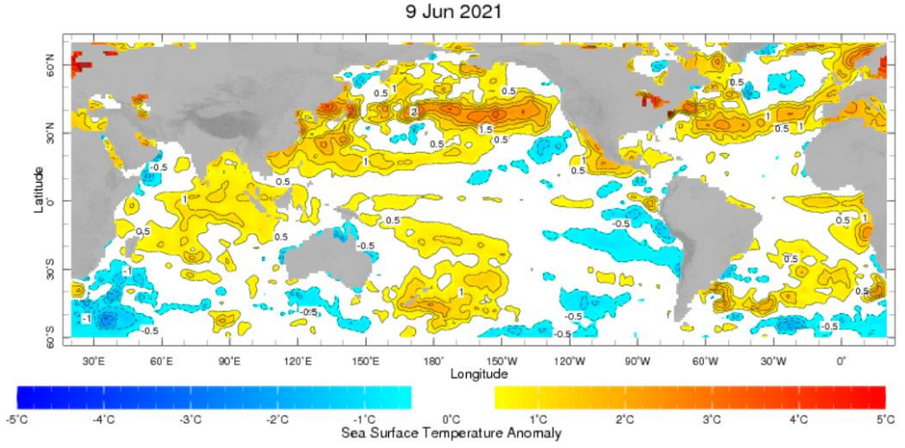

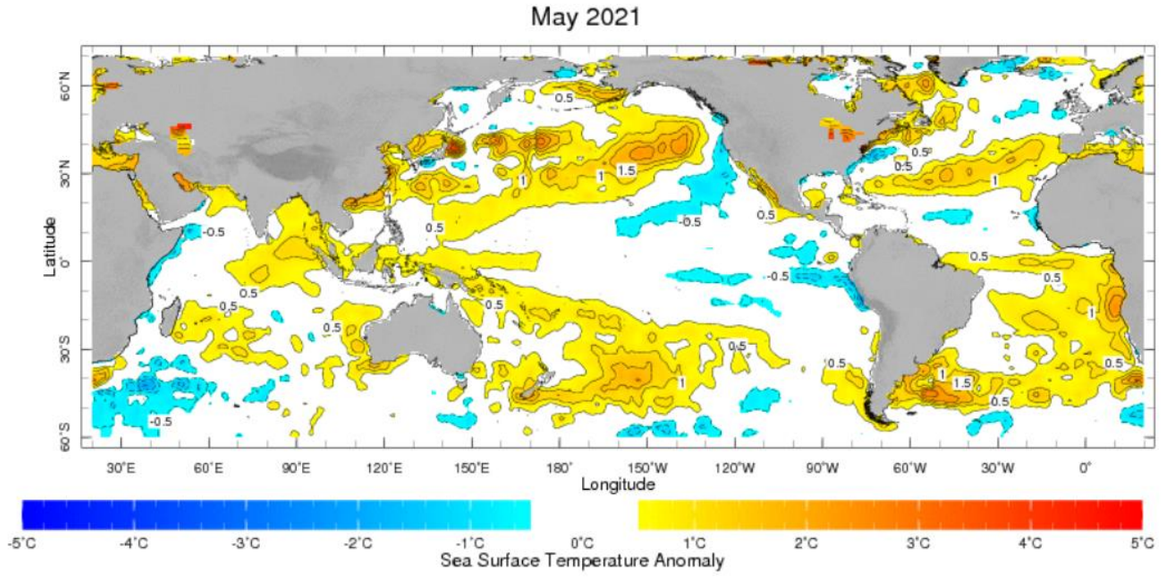

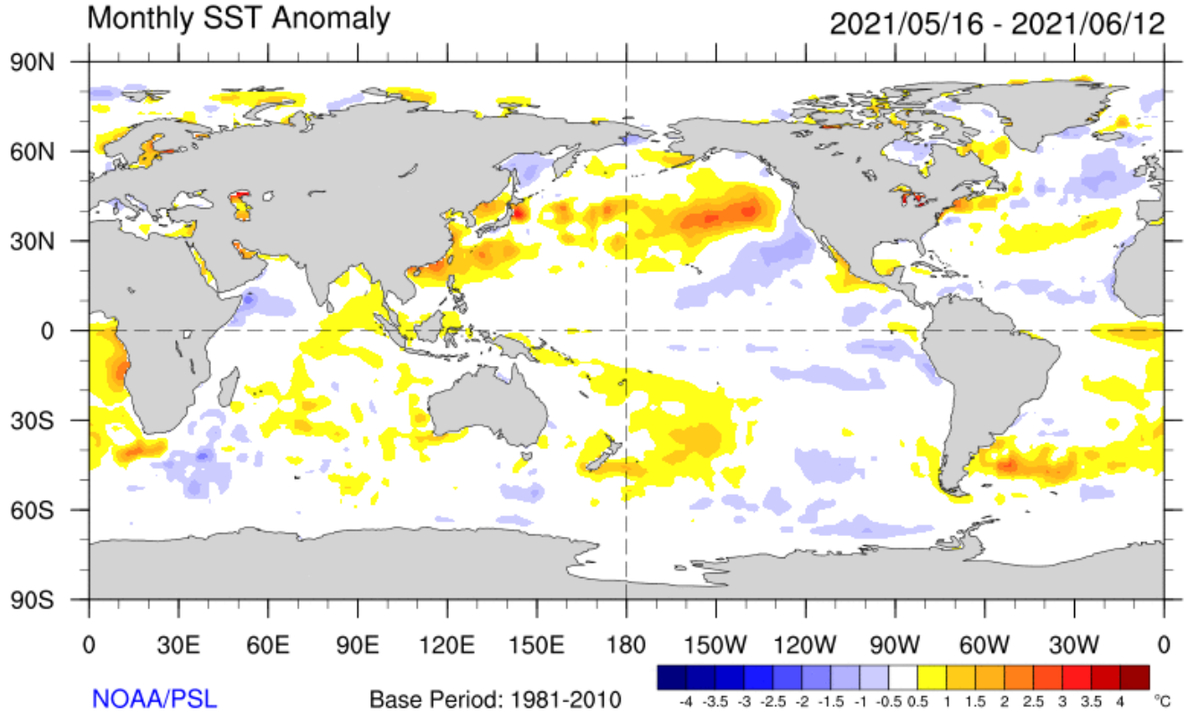

Figure 3: Maps display weekly sea surface temperature anomalies over the globe for last four weeks

Last months Sea SurfaceTemperatures (SST) Observed

During 16th of May to 12th of Jun 2021, the cooling persisted over eastern Equatorial Pacific, and the South-Western Indian Ocean, whereas the Tropical South Atlantic, and western pacific continued warming.
